

JOB MARKET PAPER

Your Paper Title Goes Here

A Subtitle That Says What the Paper Does

Your Name

Your Institution

September 2026

The Question

- Open with the thing the audience already believes, so the paper has something to push against.
- State the question in one sentence. If it takes two, it is two questions.
- Say why it has not been answered: the data did not exist, the variation was not there, the identification was not available.

WHAT THIS PAPER CHANGES

One sentence the audience should still be able to repeat in the corridor an hour later. Write it before you write the slides.

Headline Estimates

0.41 s.d. 1 in 4

the effect at the median

attenuation from
measurement error

62,400

unit-years in the panel

Put the answer on the third slide. A seminar audience decides in five minutes whether to keep listening, and a paper that withholds its result until slide thirty is asking them to wait on trust.

SECTION 1

Design

1. Design

2. Results

Three Contributions

1 The first thing the paper does

One sentence on why it matters. Keep the claim narrow enough that you could defend it alone.

2 The second thing

Something the existing literature assumes rather than estimates, and that you can now measure.

3 The third thing

Where the estimate varies, and why that variation is the interesting part rather than a nuisance.

The Specification

$$y_{it} = \alpha_i + \delta_t + \beta D_{it} + \gamma \sum_{j \neq i} w_{ij} D_{jt} + \varepsilon_{it} \quad (1)$$

where D_{it} is treatment and w_{ij} a weight on the link between i and j . Say what each term is doing in words before you defend it, and name the one coefficient the talk is about.

State the identifying assumption here rather than in the appendix. The audience is going to ask; answering first is cheaper than being asked.

SECTION 2

Results

1. Design

2. Results

Main Estimates

Table 1: Effect of Treatment on the Outcome

	Dependent Variable: Outcome _{<i>i,t</i>}			
	OLS		IV	
	(1)	(2)	(3)	(4)
Panel A: Independent Variables				
Treatment _{<i>i,t</i>}	0.081 (0.027)	0.115 (0.031)	0.196 (0.058)	0.188 (0.064)
Panel B: Fixed Effects				
Unit		✓	✓	✓
Year			✓	✓
Region–Year				✓
Panel C: Model Summary Statistics				
First-stage <i>F</i>	—	—	38.4	27.6
Observations	62,400	62,400	62,400	62,118

Notes: Treatment is instrumented in (3) and (4). Standard errors clustered by unit.

ROBUSTNESS

IDENTIFICATION

DATA

Dynamics

Figure 1: Estimated Effect by Period Since Treatment

Notes: Shaded band is a 95 per cent confidence interval. Say what the pre-period shows before you say what the post-period shows.

Treated and Control Paths

Figure 2: Treated Units

Figure 3: Control Units

Notes: Realised path in navy, counterfactual dashed in green.

What It Adds Up To

THE RESULT

Restate the headline in the same words you used on slide three. An audience that hears it twice remembers it; one that hears two versions remembers neither.

- The mechanism, in one line.
- Where the estimate does not hold, said plainly (Callaway and Sant'Anna 2021).
- What you would need to go further, which is also your next paper.

BACKUP

Appendix

Robustness

- Alternative specifications.
- Rolling windows.
- Placebo distribution.

BACK

Identification

The assumption, stated formally, and the test that speaks to it.

BACK

ROBUSTNESS

Data

- Sources, and the period each covers.
- How the sample was built, and what it drops.
- The variable definitions someone would need to replicate you.
